# Goal

## Ecological and Economic Effects of Derelict Fishing Gear in the Chesapeake Bay

2015/2016 Final Assessment Report

Donna Marie Bilkovic<sup>1</sup>, H. Ward Slacum, Jr., Kirk J. Havens<sup>1</sup>,  
Danielle Zaveta<sup>2</sup>, Christopher F. G. Jeffrey<sup>3</sup>, Andrew M. Scheld<sup>1</sup>,  
David Stanhope<sup>1</sup>, Kory Angstadt<sup>1</sup>, John D. Evans<sup>4</sup>

Revision 2, Oct. 7, 2016

Prepared for  
Marine Debris Program  
Office of Response and Restoration  
National Oceanic and Atmospheric Administration  
Contract DG133E-10-CQ-0034, Task Order 007

# Objectives

- 1) Identify/evaluate factors contributing to distribution and densities of derelict blue crab traps
- 2) Inventory available data with regard to Obj. 1
- 3) Identify and fill data gaps – field/lab experiments
- 4) Develop a spatial model to evaluate Obj. 1 factors
- 5) Quantify ecological/economic impacts of DFG
- 6) Develop a DFG framework for use in other fisheries

# Objective 4 – spatial model

## Geographic Weighted Regression: model structure

*Response variable* = derelict fishing gear density<sup>\*</sup>

*Predictor variables* = effort<sup>†</sup>, depth<sup>\*\*</sup>, rec boats<sup>††</sup>, marine traffic<sup>\*\*\*</sup>

<sup>\*</sup>MD: systematic, side scan sonar surveys (2007); watermen clean ups (2010, 2012)

VA: fishermen field surveys/removals (2008-2012); tributary-specific surveys (2005-2011, 2015)

<sup>†</sup>MD: active trap field surveys (2007-2012); DNR reports (1994-2014); expert knowledge (2014-2016)

VA: active trap field survey (2010); VMRC reports (1994-2014)

<sup>\*\*</sup>1995 NOAA Hydrographic Survey data

<sup>††</sup>MD: fishery independent survey; VA: expert knowledge

<sup>\*\*\*</sup>Marine Cadastre Automatic Identification System (AID) data

# Objective 4 – spatial model

**Field Data**

**Prediction Grid**

# Objective 4 – spatial model

## Prediction Grid

## Predicted Densities

# Objective 4 – spatial model

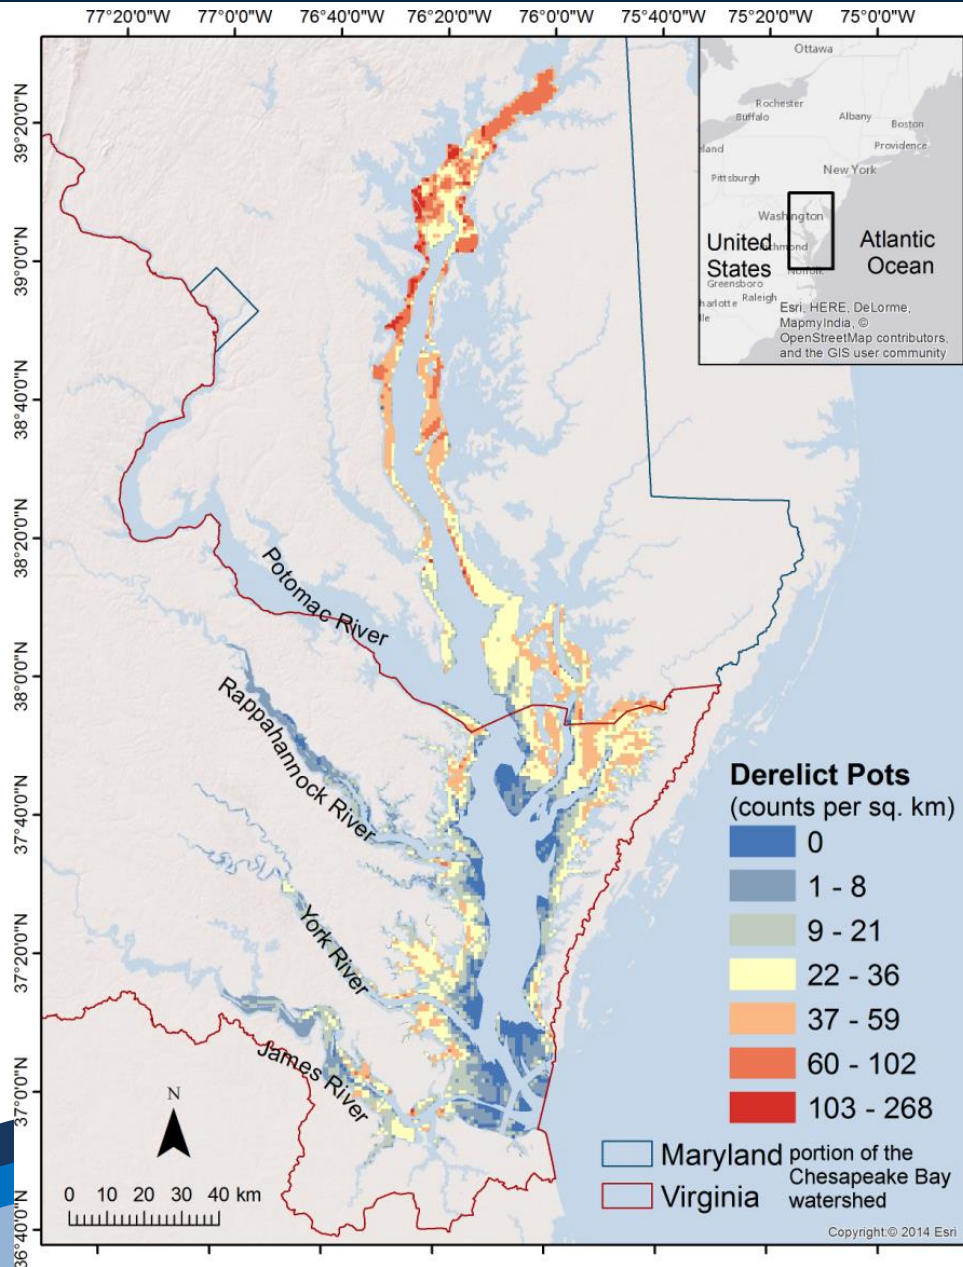

## Geographic Weighted Regression: Results

- All predictor variables were significant (effort, vessels, depth)
- Model explained 34% of the variation in the estimates of derelict crab pot density
- Derelict pot density estimates varied considerably across locations, a result of the spatial variability in the predictors
- Generally, high fishing effort + vessel traffic = high derelict pots

# Objective 4 – spatial model

## Geographic Weighted Regression: Results

### Predicted Densities of Derelict Pots

*Bay-wide: 145,000+*

*Maryland: 58,000+*

*Virginia: 87,000+*

# Objective 5 – ecological impacts

## Blue Crab Bycatch Mortality

	Mean Mortality: crabs/pot/year	# Derelict pots	Mean Mortality: total crabs / year
Maryland	20	58,185	~1.2 million
Virginia	25	87,048	~2.2 million
Bay-wide	23	145,233	~3.3 million

# Objective 5 – ecological impacts

## White Perch Bycatch Capture

	Capture: Mean fish/pot/year	# Derelict pots	Capture: Mean total fish / year
Maryland	22.4	58,185	~1.3 million
Virginia	25.6	87,048	~2.2 million
Bay-wide	24.3	145,233	~3.5 million

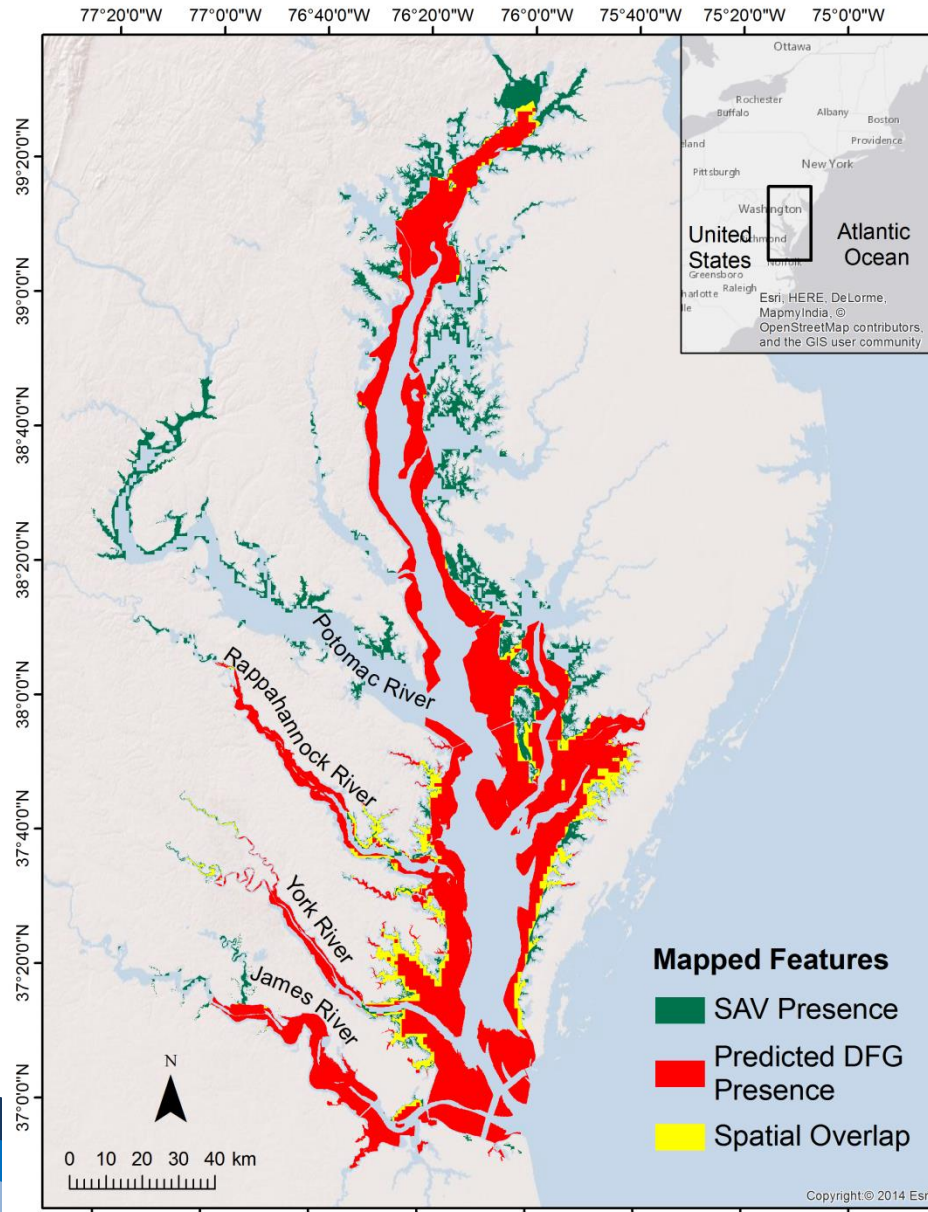

# Objective 5 – ecological impacts

## Habitat: SAV and oyster

- Pot footprint =  $0.36\text{m}^2$
- 12-20% loss rate
- 350,000 pots deployed in summer
- Potential for 15,000 – 25,000  $\text{m}^2$  impacted seafloor

# Objective 5 – ecological impacts

# Objective 5 – economic impacts

## Spatially-explicit harvest model\*

- Estimates annual harvests as a function of effort (number of pots), stock, and derelict gear removals
- Predicts harvests with and without derelict gear removals
- Compares model predictions to evaluate effect of removals on commercial harvests

*\*Scheld et al. 2016. The dilemma of derelict gear. Scientific Reports 6:19671*

# Objective 5 – economic impacts

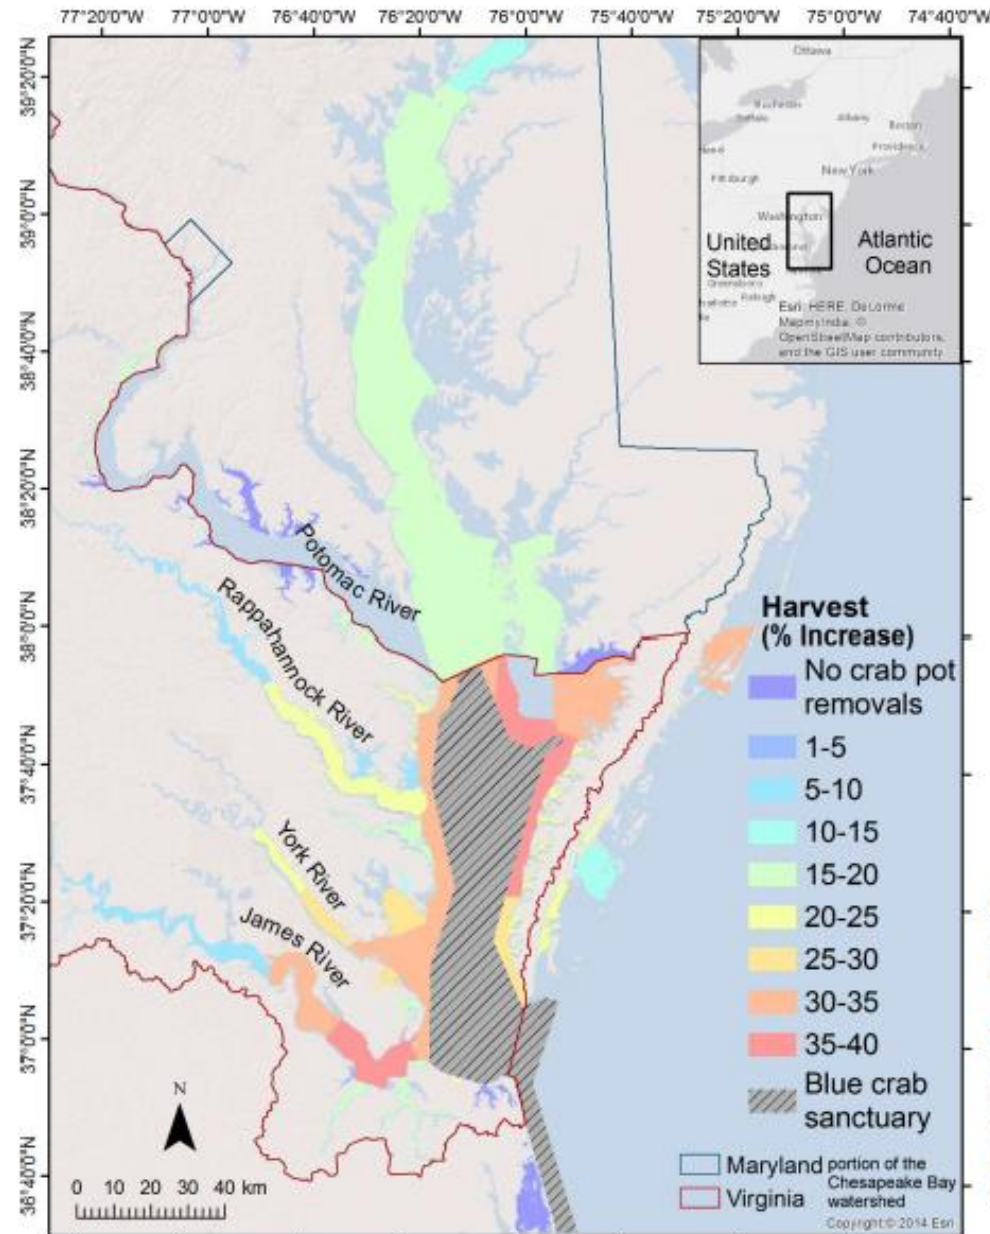

## Spatially-explicit harvest model\*

	# Traps Removed	Avg Pounds of Increased Harvest	Avg Increased Revenue
Virginia*	34,408	30 million (27%)	\$22.6 million**
Maryland	9,560	8 million (16%)	\$10.9 million**
Bay-wide	43,968	38 million (23.8%)	\$33.5 million**

*\*Scheld et al. 2016. The dilemma of derelict gear. Scientific Reports 6:19671*

*\*\*2014 dollars*

# Objective 5 – economic impacts

# Management Strategies

- Removals more effective if hotspots targeted
- Biodegradable escape panels
- Reduce overlap b/w boating and fishing activities
  - Boater education

# Objective 6 – guiding framework

## Assessing Ecological and Economic Effects of Derelict Fishing Gear: a Guiding Framework

Christopher F. G. Jeffrey<sup>1</sup>, Kirk J. Havens<sup>2</sup>, H. Ward Slacum, Jr.,  
Donna Marie Bilkovic<sup>2</sup>, Danielle Zaveta<sup>3</sup>, Andrew M. Scheld<sup>2</sup>,

# Objective 6 – guiding framework

## **Recommends best practices for 5 key elements:**

- Characterization of abundance & distribution of DFG and fishery effort
- Analyses to quantify economic impacts on target & bycatch species
- Analyses to determine impacts to living resources
- Evaluation of management implications
- Recommendations for appropriate management actions to mitigate impacts from DFG
