

Land Use Load Decisions – Phase 6

Resources

- Collaborative work with USGS-Sparrow
- Tetra Tech urban review
- Tetra Tech agricultural review
- Panel and workgroup documents and recommendations
- STAC recommendations
- Phase 5.3.2 background documentation
- Tetra Tech synthesis work

Central points

- Large balances between land uses will be set through literature and data-based methods in the modeling workgroup
- Differences between land uses within a group will be informed by discussions within source workgroups and panels
- Final calibration will be under the modeling workgroup and will balance recommendations against water quality data.
- All recommendations will be used to inform the final rates, but the observed water quality data will drive the final calibration.
