

# Shoreline and Tidal BMPs in Planning Targets

Gary Shenk

CBPO

Presentation to WQGIT 11/13/2017

## Constant Shoreline Loads for all Scenarios

Theoretical Example

Basins with same no action, e3, and relative effectiveness

Must meet 100 lbs

## Higher Shoreline Loads in NA

Higher shoreline loads in No Action scenario for Basin 2

## Constant Shoreline Loads for all Scenarios

## Lower Shoreline Loads in E3

Lower shoreline loads in E3  
scenario for Basin 2

## Shoreline Loads - Nitrogen

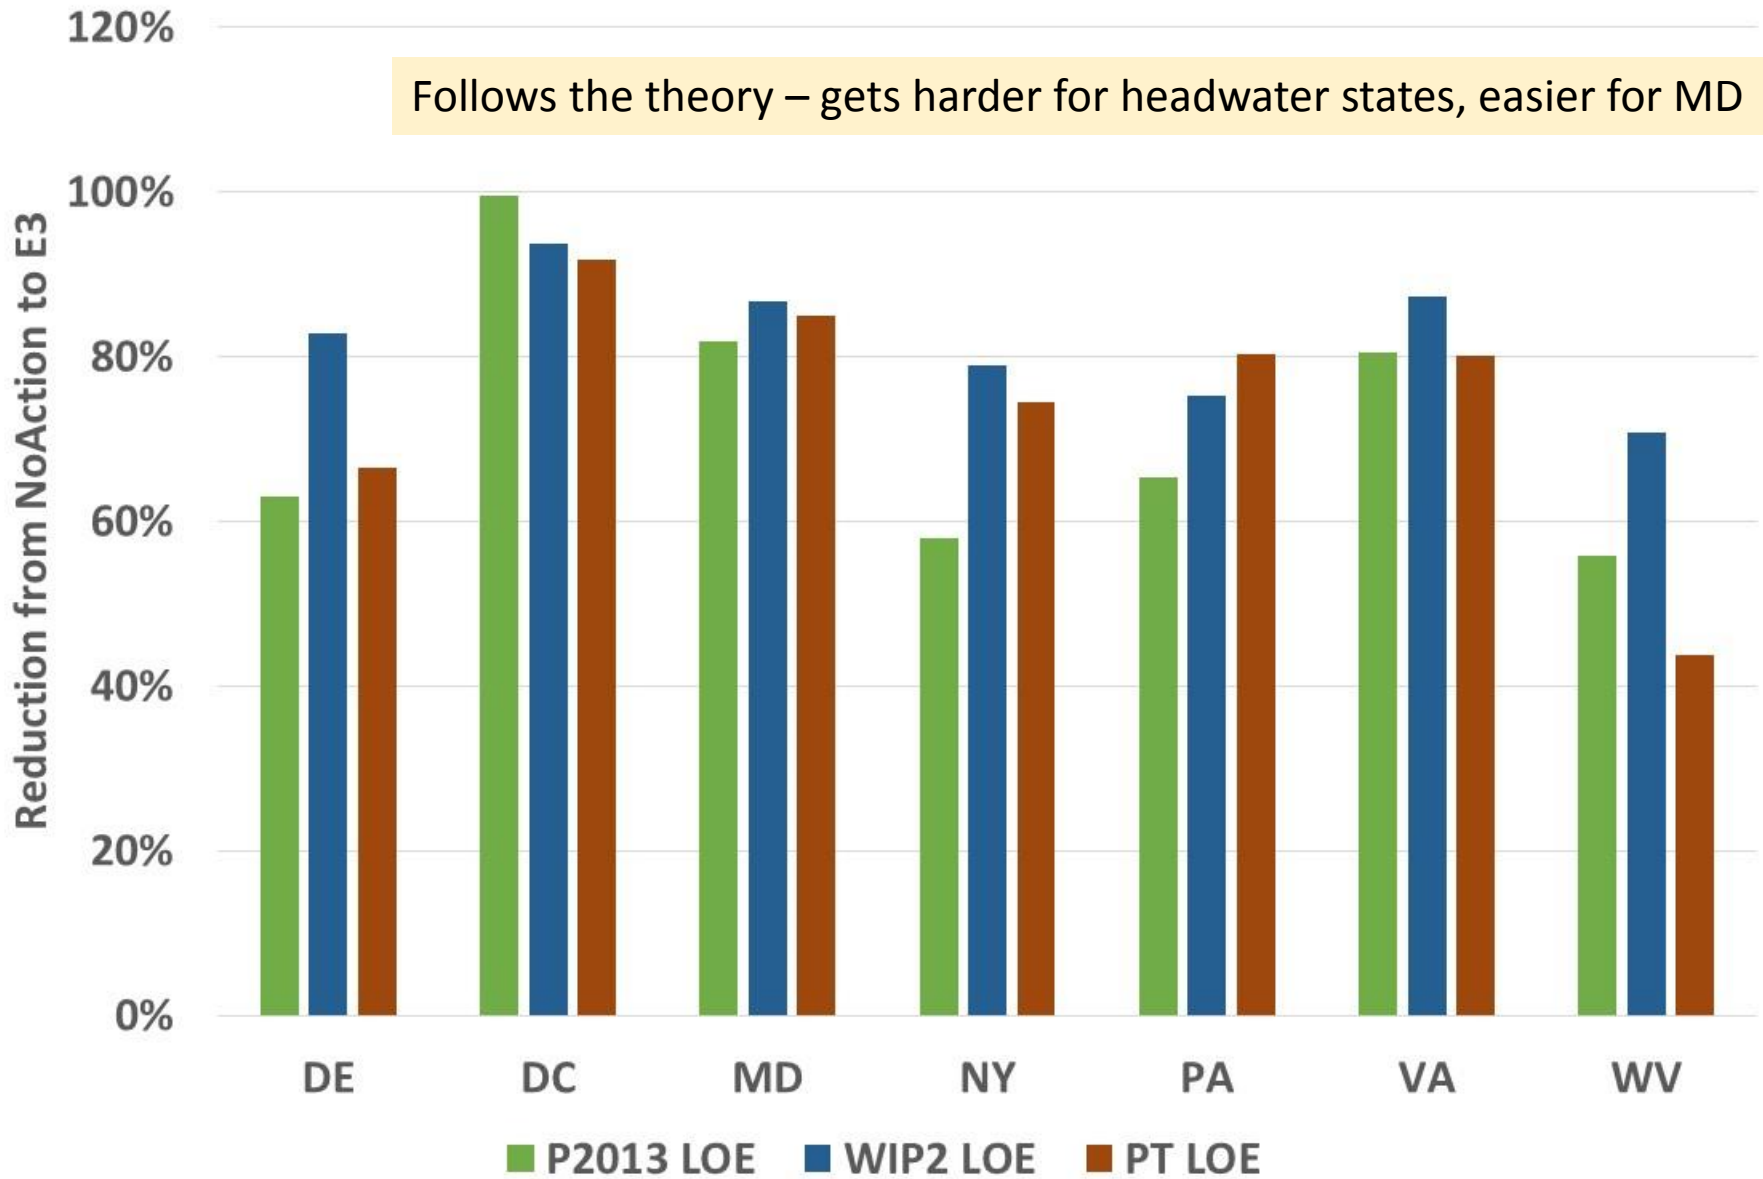

## Level of Effort by State - Phosphorus

## Level of Effort by State - Phosphorus

Hi NA shoreline

Follows the theory – gets harder for headwater states, easier for MD

# Questions about shoreline loads

- Theory behind the planning target calculation is that jurisdictions are responsible for a certain fraction of what can be done
  - Do they get credit for existing shoreline protection relative to a No Action that removes city shorelines?
    - Is shoreline like a land use that No Action doesn't affect? Forest buffers are part of the land use and they are not removed for a No Action scenario.
    - Is shoreline like a BMP that can be removed in a No Action scenario?
    - Is shoreline like a WWTP that goes to primary treatment in No Action, but not a straight pipe?

# Questions about shoreline loads

- Theory behind the planning target calculation is that jurisdictions are responsible for a certain fraction of what can be done
  - Do we have a low shoreline E3 that creates an expectation that states will do some percentage of what is available?
    - Should we expect DC Potomac to have the same percentage of protected shoreline as MD Lower Eastern Shore in an E3 case?

# Some options to consider

- “Default” - Define a no action and E3 and treat just like any other BMP
- “Extra Credit” – No part in planning target calculations, but credit is given for implementation

# Default option – Shoreline

- Define a No Action and E3 that gives reasonable credit for past action and reasonable expectation for future
- Set No Action to a true ‘No Action’?
  - Creates credit for very long-standing shoreline protection (does the construction of Baltimore Harbor count as a BMP toward the Maryland’s portion of the TMDL?)
  - Would make it hard for state-basins with lots of natural shoreline to meet targets without hardening large portions
  - Gives credit for past actions
- Set No Action to 2008?
  - Year the survey was completed
  - Gives credit for recent actions

# Default option – Shoreline

- Define a No Action and E3 that gives reasonable credit for past action and reasonable expectation for future
- Set E3 to a true “everything, everywhere”
  - Creates expectation of certain percent of shoreline protection everywhere
  - Would make it hard for state-basins with lots of natural shoreline to meet targets without hardening large portions
- The ‘all else’ line varies between 55% to 75% for tidal state-basins
- Setting No Action to 2008 and E3 to a value that is about 60% higher than expected implementation through 2025 by State-Basin would result in a reachable goal

# Default option - Oysters

- Defined a No Action and E3 that gives reasonable credit for past action and reasonable expectation for future
- Set No Action to a true 'No Action'
  - Straightforward – no implementation
- E3 was determined by suitable areas

# Extra Credit option

- No Action and E3 are both defined as the 2008 implementation
- Responsibility for implementing shoreline and tidal BMPs are taken out of the planning target calculation
- Question – What to do with the reductions from these sources?

# Extra Credit option – who gets the credit?

- Implementing jurisdiction
  - As an additional tool to meet planning targets
- Implementer
  - As tradable nutrient reductions
- The CBP partnership
  - As credits to all states proportional to planning target
  - As additional margin of safety
  - As additional assimilative capacity in future calculations

# Default Option

- Pro
  - Established method that is consistent with planning target principles
- Con
  - Creates the need for new decisions on No Action and E3
  - Could create situations with unrealistic expectations or too much credit for past actions

# Extra Credit Option

- Pro
  - Simple implementation
  - Will not create unrealistic expectations
- Con
  - Requires a decision on who gets the credit
  - May not follow the principle of the planning target calculation where state-basins are expected to implement a certain percentage of what could be implemented

# Decision Requested

- Default option
  - What are the no action and E3 levels?
- Extra credit option
  - What are to be done with the credits?
