

# **Notes on absolute status based on CDF scoring functions**

**Elgin Perry**

**6/12/2012**

**Presented to TMAW 10/07/2010**

**reviewed 5/4/2011**

**refreshed 6/12/2012**

**Basic Concept -**

**Develop a Scoring Function based on a parametric Cumulative Distribution Function (CDF).**

**This function should describe the distribution that is right on the cusp of being impaired**

## Scoring Functions

### Normal CDF

$$F(x; \mu, \sigma) = \int_{-\infty}^x \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(z-\mu)^2}{2\sigma^2}} dz$$

### Logistic CDF

$$F(x; \alpha, \beta) = \frac{1}{(1 + e^{-(x-\alpha)/\beta})^2}$$

**LogNormal Distribution.**

$$F(Y; \mu, \sigma) = \int_{y=0}^Y \frac{1}{\sigma y \sqrt{2\pi}} e^{-\frac{(\log(y) - \mu)^2}{2\sigma^2}} dy$$

**Poisson Distribution:**

$$F(X; \lambda) = \sum_{x=0}^X \frac{e^{-\lambda} \lambda^x}{x!} \quad x = 0, 1, 2, \dots \quad \lambda > 0$$

**Binomial Distribution:**

$$F(X; p) = \sum_{x=0}^X \binom{n}{x} p^x (1-p)^{n-x} \quad x = 0, 1, 2, \dots, n \quad 0 < p < 1$$

or  $\log\left(\frac{p}{1-p}\right) + \text{logistic CDF}$

or  $y = \sin^{-1} \sqrt{(r + 3/8) / (n + 3/4)} + \text{normal CDF}$

or **Beta CDF**

$$F(X; a, b) = \int_0^X \frac{x^{(a-1)} (1-x)^{(b-1)}}{B(a, b)} dx \quad 0 \leq x \leq 1, \quad a > 0, b > 0$$

## Pictures of scoring functions

## **How to quantify scoring function**

- reference data,**
- the water quality model,**
- values taken from literature review,**
- best professional judgment,**
- shifted distribution**

**minimum requirements are central tendency and measure of variance.**

**Figure 1. The empirical distribution function of chlorophyll a from 'good' regions (green step function) with an overlay of the log-normal scoring function (smooth black curve) and the ECDF of chlorophyll a from 'bad' regions (blue step function).**

## **Assessment Endpoints and inference:**

- median quantile score / beta distribution**
- mean quantile score / ? distribution**
- distribution tests, e.g. Kolmogorov-Smirnov, Shapiro-Wilks**
- bright line criteria with scientific basis**

## **Comparison to other approaches:**

## Single number criteria:

## IBI scoring approach:

**Examples of specifying Reference Distribution:**

**Mean and upper bound: mean = 15, exceed 30 not more than 10%**

## Distribution Shift:

**Figure 2. Beta density (B,18,18) showing 90% critical point**

## **Advantages:**

- **preserves continuity and ranking of original data**
- **acknowledges overlap of good and bad**
- **scores data to universal 0-1 scale to facilitate averaging over dissimilar scales**
- **scored data have uniform 0-1 statistical distribution under probability integral transform**
- **medians of scored data follow beta distribution**
- **easy to explain through grading on a curve analogy**
- **minimal requirements for specifying reference distribution**
- **has the potential to accommodate context sensitive criteria**

## **Outstanding issues:**

- Choice of scoring function**
- Nonparametric density scoring**
- Risk if density is mis-specified**
- space-time issues**
- potential for context sensitive status assessment**
- outside review**

## Example of Shifted Distribution Scoring Function for 7-day mean of Dissolved Oxygen Using York River Basin ConMon Data.

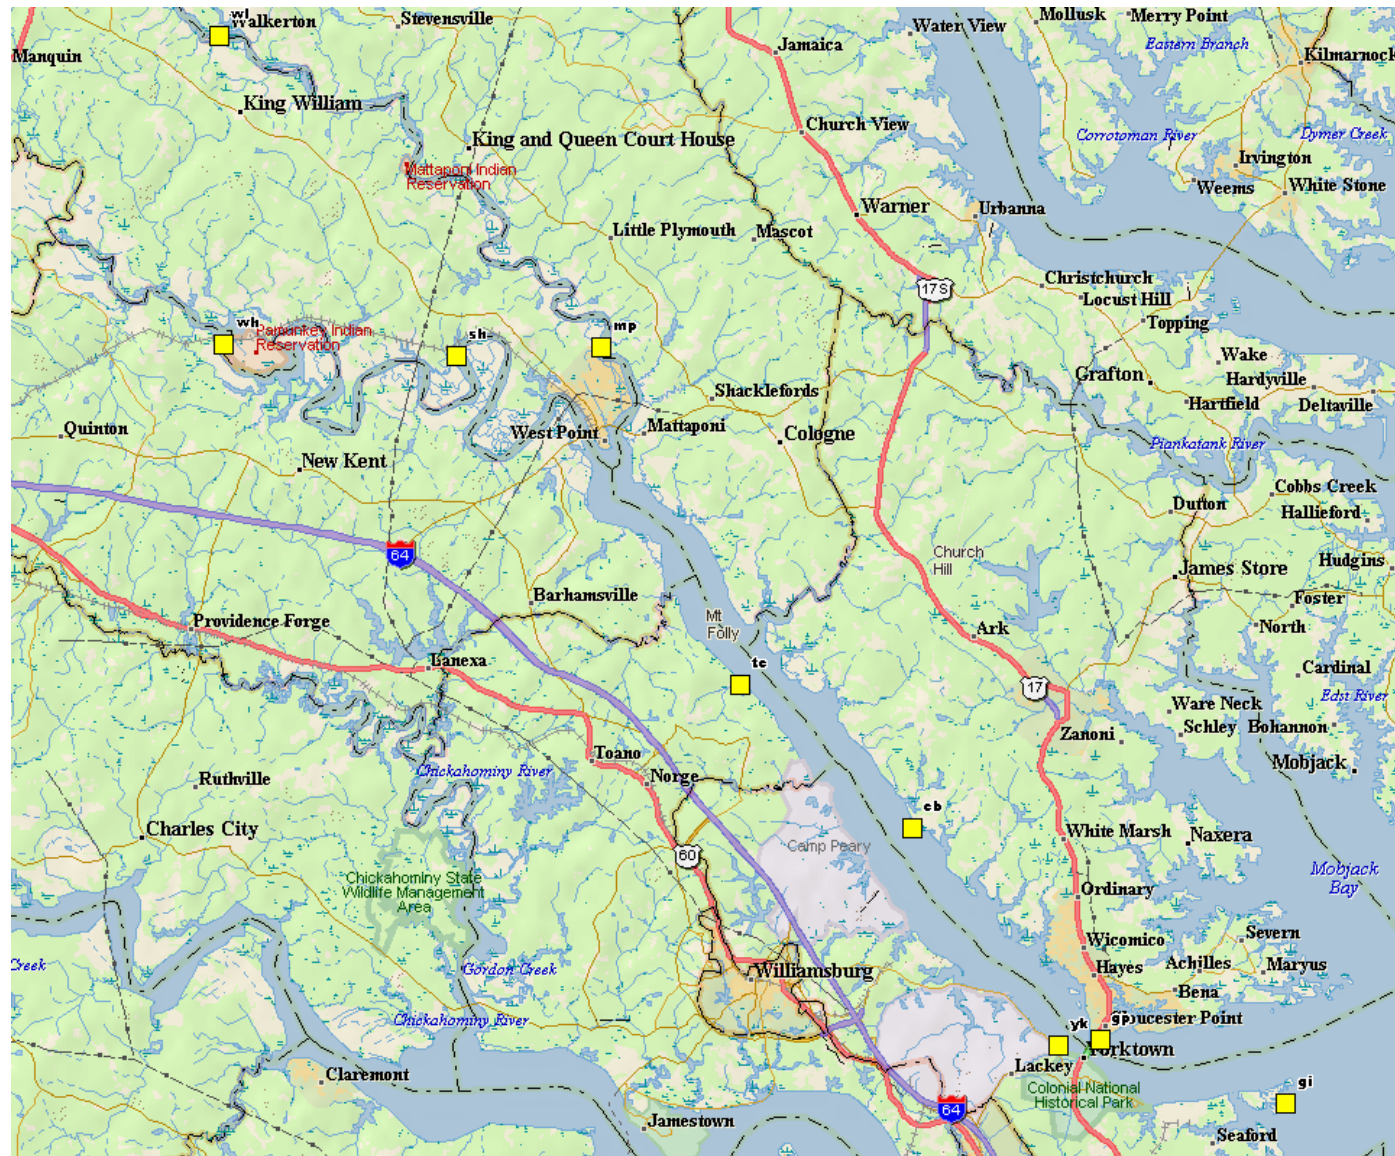

Table 1. Locations of continuous monitors in the York river and tributaries.

<b>River</b>	<b>Location Name</b>	<b>Name Abbrev.</b>	<b>Data Code</b>	<b>Years</b>
