Chesapeake Bay Monitoring

Bill Dennison Science and Technical Advisory Committee

Dec 2013

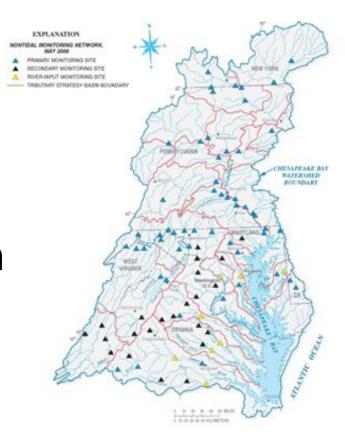

Institutional monitoring needed

- CBP sponsored monitoring provides the skeletal backbone of additional monitoring (e.g., citizen science monitoring)
- High quality, timely, accessible data with continuity is essential
- Piecemeal data does not replace integrated monitoring

Monitoring funding context

- Monitoring efforts have been curtailed over time; lean programs
- MRAT (Monitoring Realignment Action Team); 2009, ~\$1 M reallocated from tidal to non tidal monitoring
- MRAT process -> Tidal & non-tidal better integrated

Effective monitoring requires significant resources

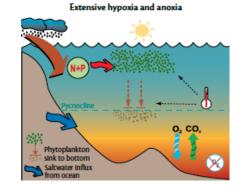

- Field work is expensive (people, equipment, vehicles, boats)
- Data analysis is time intensive (database development & maintenance, statistical analyses)
- Recurring costs are subject to inflationary pressures

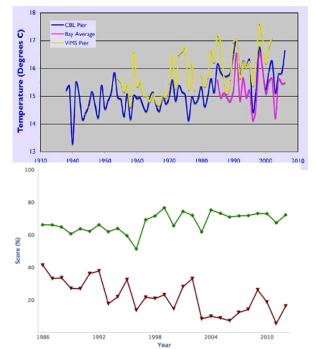

Highlights from 25 years of tidal water quality monitoring program

Identification of eutrophication causes and impacts

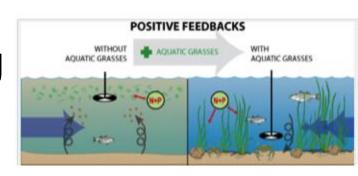

- Climate trends and impacts (e.g., DO, SAV)
- Status and trends of key indicators (e.g., improving nutrients, degrading clarity)

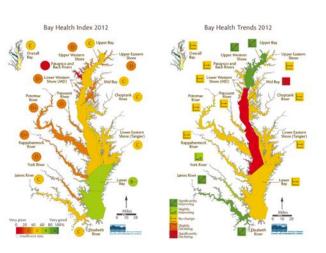

Highlights from 25 years of tidal water quality monitoring program

 Ecological thresholds 'tipping points' & feedbacks

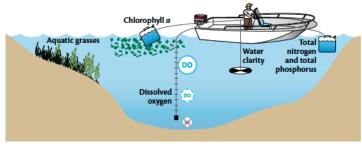

- Input to report cards, Bay
 Barometer, research programs
- Water quality criteria assessment

Citizen science can augment but CANNOT replace institutional monitoring

- Coordination needed
- Training needed; personnel turnover issue
- Continuity essential
- QA/QC issues
- There are some difficult and dangerous locations where trained personnel are needed

Technology can augment but CANNOT replace in situ sampling

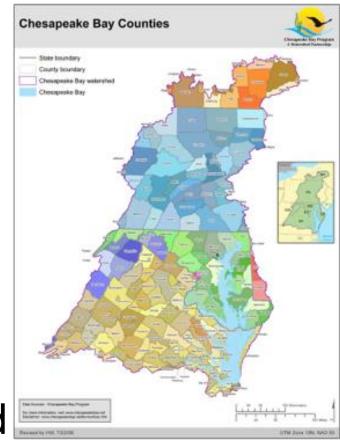

- Purchase price of technology can be prohibitive
- Technology requires calibration, maintenance, operational costs
- Some features (e.g., nutrient samples) need to be sampled on site
- We are already using technology to augment monitoring as much as possible

Local jurisdictions CANNOT contribute to funding shortfalls (on the short term)

- Cost sharing is already happening
- Internal funding restrictions reduce ability to reallocate implementation funds to monitoring
- Overall reduced budgets mean that local jurisdictions funds are already committed

But, can local jurisdictions contribute to funding shortfalls? (on the long term)

- Local jurisdictions increasingly tasked with costly implementation
- Timely & accurate feedback critically needed
- Feedback can reduce costs and result in more effective actions

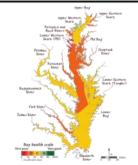

2013: Important historical moment

- Voluntary to regulatory transition
- Adoption of adaptive management approach; change in monitoring needs
- Federal: State: Local budgets & mandates changing

Water quality

Estuary science phase 1925-1970 Eutrophication science phase 1970-1983 Coordination phase 1983-2003 Accountability phase 2003-12013

JUJ – ZUIJ FUTURE

Chesapeake Synthesis Center

Goal Implementation Teams

Technical Services and Support

Understanding of estuarine processes Chesapeake Biological Laboratory established (1925) Understanding of eutrophication processes U.S. EPA established (1970) Clean Water Act (1972)

Clean Water Act (1972) UMCES is established (1972) Coordinated modeling and monitoring partnerships formed CBP created (1983) IAN established (2003)

Cost and nutrient reduction effectiveness assessment Restoration sciences created

Ecosystem response to nutrients reductions Clean water Seagrass recovery

Sustainable fisheries

STAC monitoring concerns

 'Monitoring for attainment' focus needs to shift to 'monitoring for adaptive management' (What is working?)

 Integration of citizen science and modern technologies needs to occur

 Major monitoring overhaul likely necessary, not just minor tweaks

 New Bay Agreement should clearly articulate goals, outcomes, strategies to identify monitoring needs
