**U.S. Census**

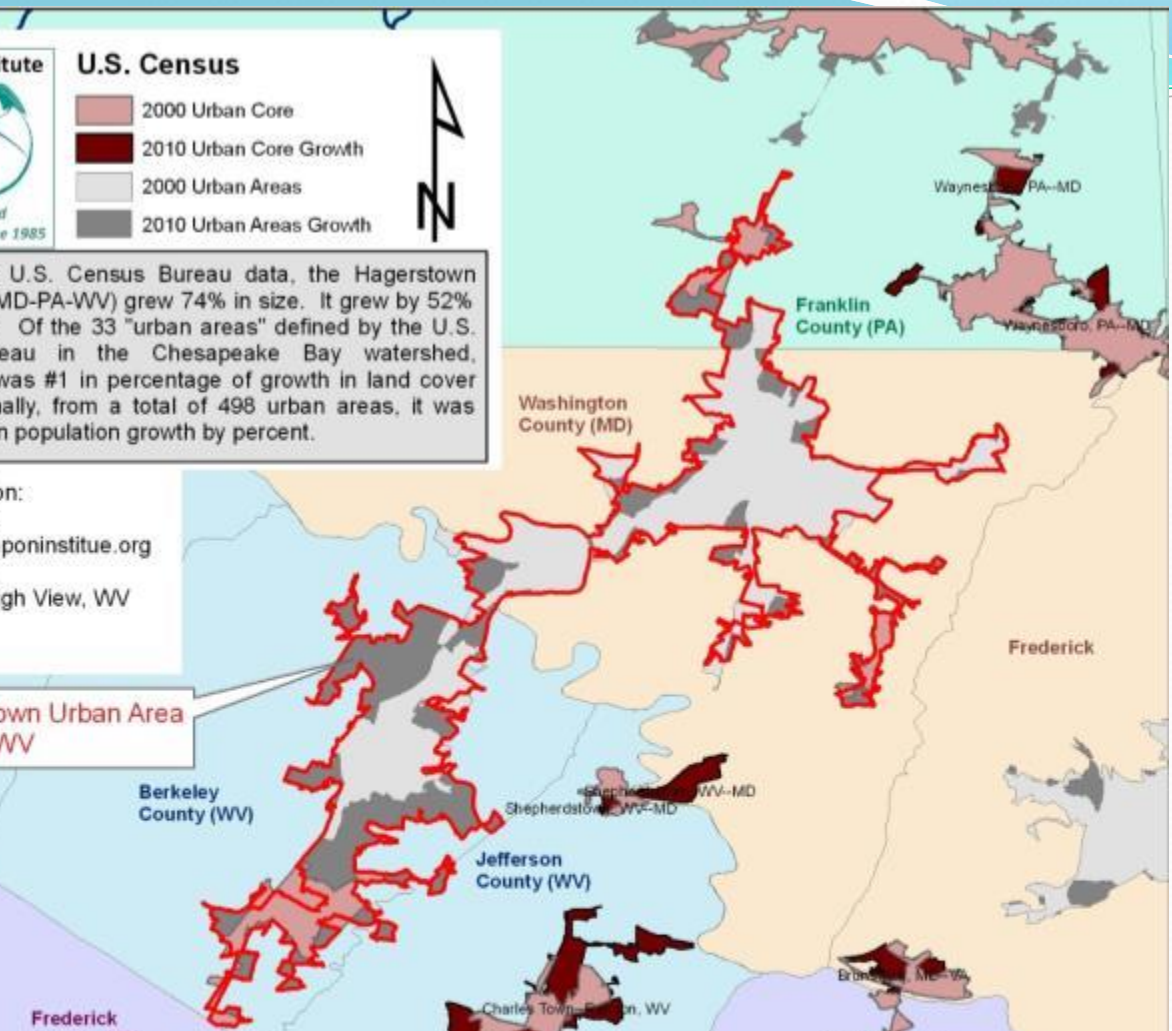

- 2000 Urban Core
- 2010 Urban Core Growth
- 2000 Urban Areas
- 2010 Urban Areas Growth

According to U.S. Census Bureau data, the Hagerstown Urban Area (MD-PA-WV) grew 74% in size. It grew by 52% in population. Of the 33 "urban areas" defined by the U.S. Census Bureau in the Chesapeake Bay watershed, Hagerstown was #1 in percentage of growth in land cover area. Nationally, from a total of 498 urban areas, it was ranked 33rd in population growth by percent.

WV four options considered including "UTC Average"

When applied city-wide the UVM-USFS Possible Tree Canopy model converts all the green, soil, and impervious landcover to tree canopy without changing existing acres of water, building or road-railroad landcover types.  
 The UVM-USFS Existing and Possible Tree Canopy by parcel for Martinsburg.<sup>6</sup>

UVM "Possible Tree Canopy." One option.

<sup>6</sup> "A Report on Berkeley County's Existing and Possible Tree Canopy" (2010) is available at the "Publication Tab" at [www.cacaponinstitute.org](http://www.cacaponinstitute.org).

Landuse and Landcover

There are 7,568 property parcels in Martinsburg in nine "property class" landuse segmented by landcover is displayed in relative acres in a 100% stacked bar graph for each property class. The minimum, maximum, 75<sup>th</sup> percentile, 25<sup>th</sup> percentile, and average tree canopy for each property class, by parcel, was identified. The Property Class Analysis section discusses in more detail the

landcover by each property class and discusses tree canopy on parcels in each property class based on the 100%, 60%, 40% and Average Hypothetical canopy. Landcover (canopy, green space, etc.) vis-à-vis landuse (apartment, commercial, farm, etc.) was analyzed. The majority of tree canopy is in the residential and farm property classes. The largest property class is residential, by acre and by the number of parcels.

Martinsburg Existing Landcover (acres)

UVM-USFS Possible Tree Canopy

40% Hypothetical Tree Canopy (acres)

60% Hypothetical Tree Canopy (acres)

Average Hypothetical Tree Canopy (acres)

## Martinsburg UTC Five “options”

ETC - Existing  
PTC – UVM Possible

### Hypothetical TC

- HTC60%
- HTC40%
- HTC Average

## Residential Class Parcels

**Analysis**  
Six thousand three hundred and ninety-eight (6,398) property parcels are classified as Residential. This represents 85% of all property parcels in Martinsburg (6398/7568 parcels). The class covers 40% of the city (1,660/4,156 acres). Statistics show:

Residential	Size (Acres)	Canopy Acres	Canopy Percent
MAX	119.66	56.14	100%
75%	0.24	0.08	44%
25%	0.10	0.00	2%
MEDIAN	0.16	0.03	23%
AVERAGE	0.26	0.09	27%
MIN	0.01	0.00	0%

Possible Tree Canopy with full conversion of suitable landcover would add 870 acres of canopy; HTC60 would add 595 acres; HTC40 would add 240 acres; and, if all residential class properties with the potential to reach the HTCA of 23% it would add 123 acres of tree canopy (9.4% city-wide). The HTCA would increase residential property class Existing Tree Canopy by 21% (123/588 acres).

## Industrial Class Parcels

**Analysis**  
Nine (9) property parcels are classified as Industrial. This represents 0.1% of all property parcels in Martinsburg (9/7568 parcels). The class covers 0.3% of the city (12/4,156 acres). Statistics show:

Industrial	Size (Acres)	Canopy Acres	Canopy Percent
MAX	7.78	0.78	79%
75%	1.18	0.23	47%
25%	0.12	0.02	10%
MEDIAN	0.24	0.06	25%
AVERAGE	1.35	0.21	32%
MIN	0.07	0.00	2%

Possible Tree Canopy with full conversion of suitable landcover would add 8.1 acres of canopy; HTC60 would add 4.9 acres; HTC40 would add 3.2 acres; and, if all industrial class properties reached HTCA of 25% it would add 2.4 acres of tree canopy (0.18% city-wide). The HTCA would increase industrial class Existing Tree Canopy by 126% (2.4/1.9 acres).

### Conclusion

As a property class Industrial has an insignificant impact on the tree canopy city-wide. As a class Industrial has the highest potential rate of canopy increase. The USDA Forest Service Possible Tree Canopy full conversion of suitable land is a 226% increase (4.3 Possible / 1.9 Existing). Even an increase that doubles the Existing Tree Canopy. Given the importance trees can play in improving lands surrounding neighborhoods. Given the small overall landuse in acres, and the small number of additional detailed investigation could lead to quick benefits.

# Martinsburg i-Tree Streets

## i-Tree Streets Inventory The City of Martinsburg

### What is i-Tree Streets?

The City of Martinsburg worked with the Martinsburg Shade Tree Commission to conduct an i-Tree Streets ("i-Tree") inventory of trees in the public right of way. Martinsburg appreciates the technical support provided by Cospon Institute and the WV Division of Forestry in conducting the survey and drafting this report. i-Tree Streets is a USDA Forest Service assessment tool used to gauge the "ecosystem services and value of a city's street tree population." Based on a random sample of street segments and user defined Input i-Tree estimates annual environmental and aesthetic benefits.

### Project Development

The City of Martinsburg has a total of 715 street segments (blocks or portions of roads and drives). To maximize the cost benefit, the inventory focused on municipally controlled streets. Segments less than 50 feet in length were excluded (e.g. alleys and driveways). This resulted in a total of 413 street segments under investigation. To achieve a high degree of statistical confidence in the results, 10% of these street segments were randomly selected (this exceeds the 8% recommended by the USDA Forest Service for similar municipalities). Based on the 10% sample, results were extrapolated to estimate the total City owned street tree population. A total of 6 miles of street segments were inventoried.

### Purpose

Street trees provide a variety of functions and play a crucial role in creating healthy, vibrant communities. Street trees provide shade and wind protection for pedestrians, clean the air and water, lower ambient air temperatures, reduce the urban heat island effect, beautify neighborhoods, and increase property values. The purpose of the i-Tree inventory was to assess the **structure, function, value, and management needs** of Martinsburg's street trees.

- Structure:** The species composition and size distribution assists City officials in anticipating future planting opportunities and the potential for engaging the community in education and action.
- Function:** i-Tree analyzes the ecosystem services, i.e., the function, the urban forest is providing. Functions include energy conservation, air quality improvement, stormwater management, and carbon dioxide reduction, among others.
- Value:** i-Tree quantifies the environmental and other benefits that the urban forest is providing, both in unit terms (e.g., kilowatt hours of electricity conserved) and in dollar terms. Based on historic management costs, i-Tree can determine the return on investment that the trees are providing. This assists City officials in developing cost-effective street tree management programs.
- Management Needs:** Based on tree condition data collected in the random sample, i-Tree forecasts maintenance requirements and priority tasks based on infrastructure conflicts to help City officials resolve community issues related to street trees.

City of Martinsburg outlined in white with the 42 randomly selected street segments highlighted in red.

### Key Terms

**Street Tree**—Defined as any tree that is located in between the road and the sidewalk OR any tree that has a canopy which extends beyond the centerline of road.

**Tree Canopy**—Tree Canopy is the layer of leaves, branches, and stems of trees that cover the ground when viewed from above.

**i-Tree Software Suite**—a state-of-the-art, peer-reviewed software suite from the USDA Forest Service that provides urban forestry analysis and benefits assessment tools.

### 2007-2009 NAIP CIR and LIDAR

**Method 1:** The USDA Forest Service's (USFS) computer assessment protocol was commissioned by Jefferson County in 2010. It was based on 2007-2009 National Agriculture Inventory Program (NAIP) color infrared (CIR) imagery and Light Detection and Ranging (LIDAR) object-height modeling. By combining NAIP and LIDAR the USFS assessment eliminates shrubs. The result is a UTC assessment estimated that is 97% accurate. The process is capable of detecting individual trees.

# Potomac Basin School UTC study

**Method 2:** Cacapon Institute conducted a human-eye assessment of schoolyard landcover for the remaining seven counties of RESA B. It is based on the same 2007-2009 NAIP imagery. CI landcover classifications, once created, were subtracted from the USFS UTC. Open space is a landcover classification that includes sports and play areas. In both methods the property parcels were approximated and boundaries drawn and the landcover types delineated.

The USFS UTC was computer generated and identified. The USFS UTC information was reclassified to match CI's transportation and buildings. In the generated assessment includes sidewalks, tennis courts, and other impervious space." Therefore Jefferson's transportation land
